CORONAVIRUS: The facts regarding swimming lessons

Chlorination stops water transmission of coronavirus, Health Services Executive advises. Drinking water and swimming pools are rendered safe by appropriate levels of chlorine.

Adherence to current disinfection practice is sufficient to “inactivate” the Covid-19 virus in chlorinated drinking water and swimming pools, according to advice prepared by the HSE and World Health Organisation to address concerns.

Per health protection surveillance, the following detailed specifics are minimally required to sufficiently inactivate COVID-19 virus in chlorinated swimming pools: for swimming pool chlorination, operating to ‘current recommendations / best practice’ means maintenance of a free chlorine residual of at least 1.0 mg/l.

Note that Berendale school’s pool has its free chlorine residual at 3.0 mg/l and is tested every 4 hours – which is well above industry standards. So be assured that we always follow specific recommendations/ best practice to ensure a safe aquatic environment for all our swim school community.

KEEP SWIMMING IN THE COOLER MONTHS: Why it matters

Experts have warned parents that they risk their child losing the progress they have made and sometimes regressing to square one without consistent quality exposure to the water.

Paediatrician and parenting expert Dr Justin Coulson warned against complacency, stressing that children learning only the basic swimming skills like how to float or tread water is "simply not enough – **they need regular quality practice**". "Having a child who knows how to swim means more than just knowing the basics," he said.

“It could be a case of one step forward, two strokes back if children don't take part in consistent quality lessons while learning to swim.”

At Babies to Kids Swim School we want your child to learn more than just the basics. We strive to make them as safe and strong a swimmer as possible – it may just save their life!
